

Fixed Income ETF Fair Value & Basket Analytics

As of 2026-05-11 01:16 London

Basket-level pricing, iNAV proxy monitoring, DV01, curve shock sensitivity and basket diagnostics for Treasury and IG credit ETFs.

Educational prototype using illustrative ETF baskets, simplified AP economics and duration-convexity pricing.

Duration computed from cashflows.

Premium / Discount History

Illustrative - synthetic history. The series is a seeded random walk with daily P/D volatility set to about 1 bp for IEF.

Interpretation

- Basket trades within market frictions; no AP edge available.
- Neither create nor redeem clears estimated costs at current marks.
- Basket concentration is moderate: top five holdings are 44.8% and the dominant bucket is 7-10y.
- Rates hedge with 102 TY contracts neutralises parallel rate DV01; residual exposure is curve and basis.

Desk relevance

- Basket valuation to approximate iNAV from constituent bond marks.
- DV01 and hedge sizing to map ETF risk into TY futures or a CDX IG credit overlay.
- Premium/discount monitoring to compare last trade against a live basket proxy rather than a static NAV input.
- Liquidity and concentration diagnostics to support AP-style execution, hedging and basis discussions.
- A compact prototype that mirrors how a fixed-income ETF desk frames iNAV, basis and hedge questions intraday.

Model summary: iNAV 101.78; Last trade 101.81; duration 7.65 yrs; convexity 66.7; weighted liquidity score 4.81/5.
